Abstract

The idea of Information and Communication Technology for development (ICT4D) has been gathering momentum since last decade. It contributes to the development of social, political, and economic growth of the underprivileged group of populations especially in the context of developing countries. Requirements Engineering (RE) is the most sensitive from all other activities involve in the ICT4D project development. This paper reports on a literature review of published ICT4D research and provides an analysis of the requirements design issues in ICT4D project development in terms of functional requirements, non-functional requirements, and user requirements. The analysis of this paper can serve the ICT4D researchers and practitioners as a means of understanding the requirements design issues in ICT4D project development.
